

Law firms of all sizes are challenged with transferring volumes of files and documents of increasingly large size to external parties. Adding to this challenge is the pressure to ensure client confidentiality. Regulations regarding the protection of intellectual property, personal data, financial transactions, and executive communications must be adopted, implemented, and integral to collaborative processes. To complicate matters further, law firms and legal departments must track information to verify and prove that breaches do not occur, and to classify the extent of exposure if they happen. Biscom Delivery Server is an advanced secure file transfer solution that has been specifically designed to meet the demanding secure file exchange requirements of today's complex legal environment.

The Next Generation of Ad Hoc Knowledge Worker Collaboration

Biscom Delivery Server (BDS) is a superior, enterprise-class secure file transfer solution designed specifically for today's more demanding ad hoc file transfer needs. Available as a Web application, Outlook add-in, or desktop client, BDS enables secure, authenticated, point-to-point delivery of files, messages, and unstructured data. With its extensive reporting and auditing capabilities, BDS can help your organization create a more secure communications infrastructure.

- As easy to use as email, the intuitive user interface will accelerate user adoption and discourage use of unsanctioned and cumbersome alternatives, such as FTP and peer-to-peer sharing services.
- BDS encrypts data in transit and at rest, reducing the risk of security breaches from sending confidential data via email and FTP.
- The BDS Microsoft Outlook add-in offloads large files from the email server, resulting in improved email performance.
- External partners and clients will appreciate the simple process for exchanging files.

Reduce Cost and Meet Compliance for Legal Document Exchange

Litigation and Practice Support

- Eliminates the overhead of administering FTP sites, along with the risk of unauthorized external party access to confidential documents.
- Reduces cost, delay and potential data breach associated with delivery of confidential data via courier or overnight delivery,
- Dramatically simplifies the process of high volume document transfer involved in discovery requests.

Attorney Communications

- Outlook add-in allows attorneys to send large attachments from the familiar Outlook email environment.
- Provides attorneys and paralegals the option to route confidential emails securely through BDS.
- Notifies attorneys when the recipient accesses a secure delivery and downloads the files.

Security Policy Auditing and Compliance

- Reduces the risk of unintended data breaches caused by unsecure email or FTP sites.
- Strong transaction tracking and reporting supports data breach monitoring and compliance with the data privacy regulations set out in the Data Protection Act.

Features:

- Remote access from any Web browser; no special client software required
- LDAP and Active Directory integration for managing enterprise users
- Integrated with Microsoft Outlook
- Allow recipients to reply securely
- Automatic restart on network failure
- Multi-level password protection, encrypted file transfers, and three-tier architecture to keep your data secure
- Built-in auditing, logging, and reporting
- Intuitive, brandable user interface
- Email notification on viewing and download
- Platform independent (runs on Windows, Linux, and Solaris)
- Java, SMTP, and Web services APIs available
